

How to Post on LinkedIn

Step-by-step guide to sharing your GitHub and platform upgrades
Optimized for investor discovery and design partner conversations

This guide gives you everything you need to make one high-impact LinkedIn post that shows what you've built, links to your GitHub profiles, and invites investor and buyer conversations — without exposing any source code or IP.

WHAT THIS POST ACCOMPLISHES

- Establishes credibility — real screenshots, real numbers, real platforms
- Drives traffic to your GitHub profiles (both personal and organization)
- Signals availability for acquisition, investment, or design partner conversations
- Protects IP — no code, no architecture details, no downloadable assets
- Uses LinkedIn algorithm best practices — text-only post with links in comments

BEFORE YOU POST — CHECKLIST

- Your GitHub personal profile is public: github.com/stephenlutar2-hash
- Your GitHub org profile is public: github.com/szl-holdings
- Both display screenshots of all platforms in a visual grid
- All source code repos are PRIVATE — no code visible anywhere
- No releases or download links exist on any repository
- Your LinkedIn profile headline mentions SZL Holdings and your role

Step-by-Step Instructions

1 Open LinkedIn and Start a New Post

Go to linkedin.com. Click "Start a post" at the top of your feed. Make sure you're posting from your personal profile (Stephen Lutar), not a company page.

2 Copy and Paste the Post Text

Copy the exact text from the next page of this PDF. Paste it into the LinkedIn post editor. Do NOT add any images or documents to the post itself — text-only posts get more reach on LinkedIn.

TIP: LinkedIn's algorithm favors text-only posts. Put your links in the FIRST COMMENT, not in the post body. This increases reach by 2-3x.

3 Publish the Post

Click "Post" to publish. Do not schedule it — post it live so you can immediately add the comment with links.

4 Immediately Add the First Comment

As soon as the post is live, add a comment with your links. Copy the comment text from page 4 of this PDF. This keeps the links visible but doesn't hurt your reach.

5 Engage With Responses

When people comment or react, respond within the first hour. LinkedIn boosts posts that get early engagement. Keep responses professional and brief. If someone asks about the code or architecture, direct them to email you for an NDA conversation.

TIP: Best times to post on LinkedIn: Tuesday-Thursday, 8-10 AM your timezone. Avoid weekends and Mondays.

6 Follow Up in 24 Hours

If the post gets good traction (10+ reactions, 3+ comments), post a follow-up comment the next day with one additional insight about your platform. This re-surfaces the post in the feed.

The Post — Copy This Exactly

Select all text in the gray box below. Copy. Paste into LinkedIn.

Just shipped a major upgrade to the SZL Holdings presence.

One founder. Six platforms. 16 live applications.

One TypeScript monorepo. One compounding architecture.

What we build:

Vessels – Maritime fleet command and intelligence

Aegis – Unified defense and security operations

Terra – Real estate market intelligence and deal pipeline

Lyte – Business observability that surfaces risk before it compounds

PRISM Counsel – Legal matter command with deadline tracking

Carlota Jo – Private advisory coordination

The numbers:

446 database tables

1,618+ API endpoints

8 web apps + 8 mobile apps

Full TypeScript – zero JavaScript

What changed this week:

- Visual showcase across both GitHub profiles
- Real screenshots of every platform
- Architecture documentation and operating philosophy
- Investor-ready documentation

The principles:

- AI cannot execute without human confirmation
- Every recommendation includes citations and confidence
- Failures surface immediately. They never hide.
- One architecture, six verticals, compounding returns.

Open to design partner conversations, enterprise evaluation, and investment introductions.

Links in comments.

HASHTAGS — Add these at the very end of your post:

#SZLHoldings #AI #AIGovernance #TypeScript #StartupFounder
#EnterpriseAI #BusinessObservability #MaritimeTech #PropTech
#LegalTech #Cybersecurity #BuildInPublic #SoloFounder

First Comment — Copy This

Post this as a comment IMMEDIATELY after publishing. This is where your links go.

Links:

GitHub (personal): `github.com/stephenlutar2-hash`

GitHub (organization): `github.com/szl-holdings`

Platform: `szlholdings.com`

Writing: `szlholdings.substack.com`

For code review, architecture walkthrough, or buyer conversations – reach me at `stephenlutar2@gmail.com`

All source code is in private repositories.
Access available under NDA for qualified parties.

WHAT TO SAY WHEN PEOPLE ASK ABOUT THE CODE

Someone will ask to see the code. Here's how to handle it:

If they ask casually:

Thanks for the interest! The source code is in private repositories. Happy to do a walkthrough under NDA – send me a note at `stephenlutar2@gmail.com`

If they seem like a serious buyer/investor:

Appreciate the interest. I have a detailed architecture document and can arrange a live demo. Let me send you more information – what's the best email?

If they ask for open-source or public access:

This is proprietary enterprise software – not open source. The GitHub profiles show what the platforms do. For architecture details, happy to chat privately.

Your Platforms — What Investors See

These screenshots are embedded in your GitHub profiles. Investors see them when they click your links.

Vessels — Maritime Intelligence

Aegis — Defense & Intelligence

Terra — Real Estate Intelligence

Lyte — Business Observability

PRISM Counsel — Legal Matter Command

Carlota Jo — Private Advisory

SZL Holdings — Command Surface

Stephen Lutar — Founder Portfolio

What Is Protected

Your GitHub presence is designed to show authority without exposing intellectual property:

- All source code repositories are PRIVATE — no one can see your code
- No GitHub releases exist — no downloadable source archives
- No tar.gz or zip files in any repository or git history
- Screenshots show the UI only — no code, no architecture diagrams, no database schemas
- The only public repos are your profile READMEs — they contain zero source code
- Clean IP — all code written by you, no contractor dependencies

What IS visible (by design):

- Platform names and descriptions
- Screenshots of each application's user interface
- High-level tech stack (TypeScript, React, PostgreSQL, etc.)
- Operating principles and philosophy
- Contact information

What is NOT visible:

- Source code — none is accessible
- Database schema or table structure
- API endpoint definitions or documentation
- Architecture diagrams or system design
- Business logic or proprietary algorithms
- Authentication or security implementation
