

Executive Demo Brief

Audience: C-suite, board, strategic partners · **Format:** 5-minute conviction demo · **Goal:** leave the executive ready to discuss next steps

"The hardest operational problem for any complex enterprise is making the right decision fast — with confidence, with evidence, and with a record. Most companies have data. Very few have a governed way to act on it."

THE GOVERNED DECISION LOOP

A live maritime scenario: three vessels outside SLA. The platform takes the executive end-to-end through nine governed steps in one screen.

- **Signal** — Detected automatically from AIS telemetry. No manual monitoring.
- **Context** — Cross-domain enrichment from Aegis (security), Terra (port congestion), and PRISM (contract clauses). Every source attributed.
- **Recommendation** — Reroute via the Strait of Malacca. 82% confidence, with reasoning visible.
- **Simulation** — 10,000-iteration Monte Carlo. Median net saving of \$1.82M for the recommended path; expected loss of \$850K for inaction.
- **Policy Gate** — Four Covenant Policies auto-evaluated in milliseconds: financial threshold, human approval, audit log, domain sign-off.
- **Approval** — Three-step human chain (Fleet Lead -> Finance Controller -> CEO). Every approver sees the same evidence.
- **Execution** — Reroute order dispatched on CEO approval. Workflow engine, not a person, makes the API call.
- **Proof Chain** — Immutable receipt: model, confidence, reviewer, timestamp, outcome. The artifact your legal, compliance, and board teams ask for.
- **Outcome** — SLA breach avoided. \$2.1M protected. Prediction accuracy logged for the next cycle.

WHY THIS MATTERS

- **Governance at machine speed.** Policy enforcement happens before anything reaches a human.
- **Evidence parity.** Every approver sees the same simulation, recommendation, and source data — no information asymmetry.
- **Permanent receipts.** Every AI-generated decision is traceable, reversible, and auditable.

KEY NUMBERS

Metric	Value
Vessels outside SLA in scenario	3
SLA exposure protected	\$2.1M
Recommendation confidence	82%
Monte Carlo iterations	10,000
Policies auto-evaluated	4
Human approvers in chain	3
Time from signal to CEO approval	33 minutes
Outcome	SLA breach avoided

WHAT COMES NEXT

Standard implementation is 60–90 days to first live signal. We work with the operations team to configure the domain packs that matter — maritime, real estate, security, legal — and tune the Covenant Policy engine to the company's existing risk and approval rules.

The AI proposes. Humans decide. The proof chain remembers.
