LINKEDIN POST — Copy & Paste

Most industries still run on disconnected tools, spreadsheets, and siloed data.

I spent the last two years doing something about it.

I built SZL Holdings — a portfolio of 16 production applications designed to give operators real command over their business. Not dashboards that look pretty. Systems that actually close the loop from signal to decision to action.

Here's what that looks like in practice:

Vessels — Maritime operators track 214+ vessels in real time, manage fleet risk, and run logistics from a single command center. No more toggling between AIS providers and Excel.

Aegis — Security teams get a unified SOC: threat correlation, incident response, compliance reporting. Enterprise-grade cybersecurity operations without stitching together five different tools.

Lyte — AI and ML teams manage model deployments, monitor performance, and track a \$4.17M portfolio of AI assets. One place. Full visibility.

Terra — Real estate operators manage pipeline intelligence, deal flow, and market analysis without living inside a CRM that wasn't built for them.

PRISM Counsel — Legal teams run matter management, case tracking, and billing from an interface designed for how lawyers actually work.

Carlota Jo — A consulting platform for luxury advisory and high-touch client management.

Every one of these platforms runs on the same shared architecture:

- ! 375 database tables
- ! 1,618+ API endpoints
- ! Full TypeScript stack — web, mobile, and API
- ! One monorepo, shared component library, shared infrastructure

That's the part I'm most proud of. Each new vertical doesn't start from scratch — it compounds on what's already been built. Same data layer. Same authentication. Same deployment pipeline. The seventh platform was dramatically faster to ship than the first.

This isn't theoretical. These are live systems, in production, serving real workflows.

I built all of it as a solo founder. Not because I wanted to prove a point, but because I believe the best way to understand a market is to build the tool operators actually need — and the best way to build at scale is to invest in architecture that compounds.

If you're in maritime, cybersecurity, AI/ML, real estate, legal, or enterprise operations — and you're tired of tools that weren't built for how your team actually works — I'd genuinely love to hear what you're dealing with.

And if you're an investor or operator who values shipped product over pitch decks, let's connect.

INVESTOR / PARTNER DM RESPONSE

Appreciate you reaching out — happy to share more.

SZL Holdings is a holding company I founded to build vertical command systems for industries where operators are still stuck cobbling together generic tools. Maritime, cybersecurity, AI ops, real estate, legal — each platform is purpose-built for how those teams actually work.

The key insight is the shared architecture. Every platform runs on the same TypeScript monorepo, same database layer, same component library. That means each new vertical ships faster and more reliably than the last, without starting from zero.

I'm the sole technical founder — designed, built, and shipped all 16 applications. Happy to walk you through the architecture, the go-to-market thinking, or give you a live demo of any of the platforms.

What works best for you — a quick call this week, or would you prefer I send over a brief deck first?

COMMENT REPLY TEMPLATES

Use these to reply to common engagement on the post. Keep it conversational and warm.

When someone says "This is impressive" or "How did you build all this?"

Thank you — it really comes down to investing in the right architecture early. Once the shared infrastructure was solid, each new platform built on top of it instead of starting over. The compounding effect is real. Happy to walk through any of it if you're curious.

When someone in maritime / cybersecurity / real estate asks about their industry

Would love to hear more about what your team is currently using. A lot of what I built came from talking to operators who were frustrated with generic tools that don't fit their workflow. If you have 15 minutes, I'd be genuinely interested in understanding your pain points — no pitch, just a conversation.

When a developer / technical person asks about the stack

Full TypeScript monorepo — React + Vite on web, Expo for mobile, Express API layer, Drizzle ORM with PostgreSQL. Shared component library and shared database schemas across all platforms. The real unlock was making the shared services layer robust enough that spinning up a new vertical is mostly configuration, not greenfield development. Happy to go deeper on any of it.

When someone asks "Are you hiring?" or "Do you need a co-founder?"

Appreciate the interest. Right now I'm focused on proving out the model as a solo operator, but as the platforms grow, building out the team is definitely on the roadmap. Best way to stay in the loop is to connect here — I'll share updates as things evolve.

When someone asks "Are you raising?"

Open to the right conversations. The thesis is that compounding infrastructure across verticals creates a fundamentally different kind of leverage than single-product companies. If that resonates, I'd love to connect — DM me or email stephenlutar2@gmail.com and we can set up a call.

RECOMMENDED CAROUSEL IMAGES

Upload these as a LinkedIn carousel (10 image max). Best screenshots from each platform — no cookie banners, clean UI.
